In this paper we prove the existence of common fixed points of $\beta \psi$ weak generalized rational contraction mappings with two metrics spaces endowed with a directed graph. We provided examples in support of our results.

Keywords: Fixed Point; directed graph; Geraghty contraction; metric space.
AMS(2010) Mathematics Subject Classification: 47H10, 54H25.

## 1. INTRODUCTION AND PRELIMINARIES

Banach contraction principle is one of the most fundamental results in fixed point theory; by extending the contractive condition and the ambi- ent space, there are several extensions and generalizations. Jachmski [17] extended the structure of orders is replaced by the structure of Graphs on metric spaces in extended fixed point theory. The intersection of theories of fixed point findings with single and multi valued mappings is known as fixed point theory and graph theory. Many researchers $[2,3,6,8,9]$ studied fixed point results on various spaces endowed with graphs. Fixed point results ex- tended using Gerghty [15, 4]contractions with specific properties. Recently [7] proved the existence of fixed point theorems of auxiliary functions frac- tional differential equations with applications.
Note that metric fixed point and graph theory have common application environments. In the multivalued case, the authors in [3] proved a fixed point theorem for Mizoguchi-Takahashitype contractions on a metric space endowed with a graph. For further results in this direction, we refer to [4-11]. Recently, in [12], the authors introduced a new concept of contrac- tions called F-Khan contractions and proved a related fixed point theorem. The investigation of iterative plans for different classes of contractive and nonexpansive mappings is a focal point in measurement fixed point hypothe- sis. It began with crafted by Banach who demonstrated an old style hypoth- esis, known as the Banach constriction guideline, for the presence of a one of a kind fixed point for a withdrawal. The significance of this outcome is that it likewise gives
the intermingling of an iterative plan to the one of a kind fixed point. A few creators have likewise given results managing the pres- ence and estimate of fixed marks of specific classes of non expansive-type multi functions. Suzuki laid out some strategies which broaden the notable withdrawal techniques for mappings and multi functions. It is realized that consolidating a few branches is a regular movement in various areas of science particularly in math. Normally, it is prominent in fixed point hypothesis. Throughout recent many years, there have been a great deal of movement in fixed point hypothesis furthermore, one more branches in arithmetic such differential conditions, calculation and mathematical geog- raphy. In 2005, Echenique gave a short and useful evidence of an expansion of Tarski's proper point hypothesis which is significant in the hypothesis of games. In 2006, Espinola and Kirk provided useful results on combining fixed point theory and graph theory [6]. In 2008 and 2009, Jachymski con- tinued this idea by using different view (see [8] and [7]). Then, Beg, Butt and Radojevic obtained some results in 2010 (see [2]) in the same direction. In this paper, we present some iterative scheme results for G-contractive and G-nonexpansive maps on graphs.

## 2. DEFINITIONS

Definition 1. [17] Let ( $\mathrm{X}, \mathrm{d}$ ) be a metric space and $\Delta$ denote the di- agonal of the Cartesian product XxX . The metric space ( $\mathrm{X}, \mathrm{d}$ ) is said to be endowed with a directed graph or digraph $G=(V(G), E(G))$ if $G$ is a directed graph such that the vertex set $V(G)$ contains all the elements of $X$ and the edge set $\mathrm{E}(\mathrm{G})$ contain $\Delta$ while excluding parallel edges.

Definition 2 [9] Suppose that $(X, d)$ is a metric space with endowed with a graph, and $\mathrm{S}, \mathrm{T}$ $: X \rightarrow X$ are functions. Let $X(S, T):=\{u \in X:(S u, T u) \in E(G)\}$
$C(S, T):=\{u \in X: S u=T u\}$
$C(S, T)$ is the set of all coincidence points of $S$ and $T$, and $C m(S, T):=\{u \in$
$X: S u=T u=u\}, C m(S, T)$ is the set of all common fixed points of $S$ and $T$.
Lemma 1 [17] let ( $\mathrm{X}, \mathrm{d}$ ) be a metric space with endowed with a directed graph $\mathrm{G}=(\mathrm{V}(\mathrm{G})$, $\mathrm{E}(\mathrm{G})$ ), and let $\mathrm{S}, \mathrm{T}: \mathrm{X} \quad \mathrm{X}$ be functions. If $\mathrm{C}(\mathrm{S}, \mathrm{T})=\varphi$, then $\mathrm{X}(\mathrm{S}, \mathrm{T})=\varphi$.
Definition 3 [9] Suppose that (X, d) is a metric space endowed with a digraph $G=(\mathrm{V}(\mathrm{G})$, $\mathrm{E}(\mathrm{G})$ ), and let
(1) A mapping $\mathrm{T}: \mathrm{X} \rightarrow \mathrm{X}$ is said to be G - continuous at x in X , whenever, for a sequence $\{\mathrm{xn}\}$ in X such that $(\mathrm{xn}, \mathrm{xn}+1) \in \mathrm{X}$ for each $\mathrm{n} \in \mathrm{N}$, we have that if $\mathrm{xn} \mathrm{x} X$, then $T \mathrm{xn} T \mathrm{x}$.
More over, T is called G - Continuous whenever it is G- continuous at every element x in X .
(2) The set $E(G)$ is said to transitive property, for all $x, y, z \quad X$, if ( $x, z$ ), (z, y) $E(G)$, then ( $x, y$ ) $\quad E(G)$.
(3) The triple ( $\mathrm{X}, \mathrm{d}, \mathrm{G}$ ) is said to have the property A whenever, for any sequence $\{\mathrm{xn}\}$ in $X$ such that $\mathrm{xn} \rightarrow \mathrm{x} \in \mathrm{X}$ and $(\mathrm{xn}, \mathrm{x}(\mathrm{n}+1) \in \mathrm{E}(\mathrm{G})$ for all $\mathrm{n} \in \mathrm{N}$, it is true that $(\mathrm{xn}, \mathrm{x}) \in \mathrm{E}(\mathrm{G})$ for all $n \in N$.
Definition 4 [18] Let ( $\mathrm{X}, \mathrm{d}$ ) be a metric space, and let $\mathrm{S}, \mathrm{T}: \mathrm{X} \rightarrow \mathrm{X}$ be
functions. Then S is said to be d- compatible whenever lim
$\mathrm{n} \rightarrow \infty$
$\mathrm{d}($ STxn, $\operatorname{TSxn})=$

0 for all sequence xn in X with lim
$\mathrm{n} \rightarrow \infty$
$\operatorname{Txn}=\lim$
$\mathrm{n} \rightarrow \infty$

Sxn

Definition 5 [9] Let ( $\mathrm{X}, \mathrm{d}$ ) and $\mathrm{Y}, \mathrm{dJ}$ ) be metric spaces, and let $\mathrm{S}: \mathrm{X} \rightarrow \mathrm{Y}$ and $\mathrm{T}: \mathrm{X} \rightarrow \mathrm{X}$ be functions. Then $T$ is said to be $S$ - Cauchy on $X$, for any sequence $\{x n\}$ in $X$ with $\{T x n\}$ being Cauchy in ( $\mathrm{X}, \mathrm{d}$ ), the sequence
$\{\operatorname{Sxn}\}$ is Cauchy in Y, dJ.
Let $\varphi:[0, \quad):[0, \quad)$ be a function such that : $\varphi$ is an increasing function; $\varphi$ is a continuous function ; $\varphi(\mathrm{t})=0$ if and only if $\mathrm{t}=0$.

Consider the class $\mathrm{A}(\mathrm{X})$, where X is a metric with metric d. Let h :
XxX [0, 1], if lim
$\mathrm{n} \rightarrow \infty$
$h(t n, s n)=1$ then $\lim$
$\mathrm{n} \rightarrow \infty$
$\mathrm{d}(\mathrm{tn}, \mathrm{sn})=0$ where the se-
quences tn , tn in X .
The existence of common fixed point theorems for auxiliary functions with two metrics endowed with a digraph was defined and proved by Ben Won- gasaiji, Phakdi Charoensawan, Teeranush Suebcharoen and Watchareepan Atiponrat in 2021.[7]

Definition 5 [7] Let (X, d) be a metric space endowed with a directed Graph $G=(V(G), E(G))$, and let $\mathrm{S}, \mathrm{T}: \mathrm{X} \quad \mathrm{X}$ be functions. The pair $\mathrm{S}, \mathrm{T}$ is an $\mathrm{h} \varphi$-contraction with respect to d whenever the following conditions hold:
(1) With regard to G, S is T -edge preserving;
(2) there are two functions, h in $\mathrm{A}(\mathrm{X})$, and $\varphi$ in $\Phi$, such that for any $\mathrm{x}, \mathrm{y}$ in $X$ with (Tx, Ty) in $E(G)$,
$\varphi(d(T x, T y)) \quad h(S x, S y) \varphi(R(S x, S y))$,
where R : $\mathrm{XxX} \quad[0, \quad)$ is a function such that, for any $\mathrm{x}, \mathrm{y} \mathrm{X}$, $R(S x, S y)=\max \{\quad, d(S x, S y), d(S x, T x), d(S y, T y), \quad\}$
Theorem 2.1. [7] Let ( $\mathrm{X}, \mathrm{dJ}$ ) be a complete metric space endowed with a directed graph $\mathrm{G}=$ $(\mathrm{V}(\mathrm{G}), \mathrm{E}(\mathrm{G})$ ), let d be another metric on X , and let $\mathrm{S}, \mathrm{T}: \mathrm{X}$ X be functions. Suppose that ( $\mathrm{S}, \mathrm{T}$ ) is an $\mathrm{h} \varphi$ - contraction with respect to d, Further, assume that the following conditions satisfied:
(i) $\quad \mathrm{S}:(\mathrm{X}, \mathrm{dJ})(\mathrm{X}, \mathrm{dJ})$ is a continuous function such that $\mathrm{S}(\mathrm{X})$ is dJ - closed;
(ii) $\quad \mathrm{T}(\mathrm{X}) \quad \mathrm{S}(\mathrm{X})$;
(iii) $\mathrm{E}(\mathrm{G})$ is transitive;
(iv) If d $<\mathrm{dJ}, \mathrm{T}:(\mathrm{X}, \mathrm{d}) \rightarrow(\mathrm{X}, \mathrm{dJ})$ is G- Cauchy on X ;
(v) $\quad \mathrm{T}:(\mathrm{X}, \mathrm{d}) \rightarrow(\mathrm{X}, \mathrm{dJ})$ is G- continuous, and T and S are dJ -compatible.
$X(T, S) /=\varphi$ if and only if $C(T, S) /=\varphi$.
In 1973, Geraghty [15]enhanced the Banach Contraction Principle by sub- stituting a function with particular features for the contraction constant.
We denote $S$ is the class of functions
$\beta: \mathrm{R}+\rightarrow[0,1)$ satisfying, for a sequence $\{\mathrm{tn}\}$ in $\mathrm{R}+$ such that $\beta(\mathrm{tn}) \rightarrow$
$1=\Rightarrow t n \rightarrow 0$
Definition 5 [15] Let $M$ be a metric space with metric d. A self map T : M $\quad M$ is said to be Geraghty contraction if there exist $\beta \quad$ S such that $d(T x, T y) \beta(d(x, y)) d(x, y)$ for all $x, y$ in $X$. In 1884, M.S. Khan, M. Swaleh, S. Sessa, introduced the class of altering distance functions[21], which we denote $\Psi=\{\psi: \mathrm{R}+\rightarrow \mathrm{R}+$ such that (i) $\psi$ is non decreasing, (ii) $\psi$ is continuous (iii) $\psi(\mathrm{t})=0=\mathrm{t}=0\}$
In this section, we use a Graph Structure to prove the presence Common fixed points of Geraghty generalized rational type weak contraction maps with altering distance functions

## 3. MAIN RESULTS

Definition 2.1 Let $M$ be a metric space with metric d endowed with a digraph $G=(V(G)$, $\mathrm{E}(\mathrm{G})$ ), and let $\mathrm{f}, \mathrm{g}: \mathrm{X} \quad \mathrm{X}$ be functions. The pair $\mathrm{A}, \mathrm{B}$ is is said to be $\beta \psi$ weak rational contraction with respect to d if
(1) with regard to the graph $\mathrm{G}, \mathrm{A}$ is B-edge preserving;
(2) there exists two functions $\beta \in \mathrm{S}$ and $\psi \in \Psi$ such that, for all $\mathrm{x}, \mathrm{y} \in \mathrm{X}$
with $(\mathrm{Bx}, \mathrm{By}) \in \mathrm{E}(\mathrm{G})$, we have
$\psi(\mathrm{d}(\mathrm{Ax}, \mathrm{Ay})) \leq \beta(\psi(\mathrm{K}(\mathrm{Bx}, \mathrm{By})) \psi(\mathrm{K}(\mathrm{Bx}, \mathrm{By}))+\mathrm{L} \cdot \mathrm{N}(\mathrm{Bx}, \mathrm{By})$, for $\mathrm{L} \geq 0$ where $\mathrm{K}: \mathrm{MxM} \rightarrow$ $[0, \infty)$ is a function such that, for any $x, y \in X, K(B x, B y)=\max \{d(B x, A x) d(A y, B y)$, $d(B y, A y)[1+d(B x, A x)], d(A x, B x)[1+d(A y, B y)]$, d(By,Ax)[1+d(Ax,By)],d(Bx, By), d(Bx,Ay)+d(By,Ax) \}
$N(B x, B y)=\min \{d(B x, A x) d(A y, B y), d(B y, A x)[1+d(A x, B y)], d(B x, B y), d(B y, A y)\}$

Theorem 3.1. Let M be a complete metric space with metric dJ endowed with a digraph $\mathrm{G}=$ $(\mathrm{V}(\mathrm{G}), \mathrm{E}(\mathrm{G})$ ), let d be another metric on M , and let $\mathrm{A}, \mathrm{B}: \mathrm{M}$ M be functions. Suppose
that ( $\mathrm{A}, \mathrm{B}$ ) is an $\beta \psi$ weak rational contraction with respect to d, Further, assume that the following conditions satisfied:
(i) $\quad B:(M, d J)(M, d J)$ is a continuous function such that $A(X)$ is dJ- closed;
(ii) $\quad \mathrm{A}(\mathrm{M}) \quad \mathrm{B}(\mathrm{M})$;
(iii) $\mathrm{E}(\mathrm{G})$ is transitive;
(iv) If d $<\mathrm{dJ}, \mathrm{A}:(\mathrm{M}, \mathrm{d}) \quad(\mathrm{M}, \mathrm{dJ})$ is G- Cauchy on X ;
(v) $\quad \mathrm{A}:(\mathrm{M}, \mathrm{d}) \quad(\mathrm{M}, \mathrm{dJ})$ is G- continuous, and A and B are dJ -compatible. then A and B have a coincident points.
Proof. Let $t 0 \in M$ be such that $(B t 0, B t 1) \in E(G)$. Since $A(M) \subset B(M)$ and $A(t 0) \in M$.
Choose $\mathrm{t} 1 \in \mathrm{M}$ such that $\mathrm{A}(\mathrm{t} 0)=\mathrm{B}(\mathrm{t} 1)$
we can construct a sequence $\{\operatorname{tn}\}$ in $M$ such that $B(t n)=A(t(n-1))$ for each $n \in N$.
If $\mathrm{B}(\mathrm{tn}+1)=\mathrm{B}(\mathrm{tn})$ for some $\mathrm{n} \quad \mathrm{N}$ i.e., $\mathrm{A}(\mathrm{tn})=\mathrm{B}(\mathrm{tn})$, tn is a coincident
point of A and B.
Hence, without loss of generality, we may assume that $\mathrm{Btn} /=\mathrm{Btn}+1$ for each
$n \geq N$. Since $(B t 0, A t 0)=(B x 0, A x 1) \in E(G)$, and the function A e-edge preserving with respect to G , so that $(\mathrm{At} 0, \mathrm{At} 1)=(\mathrm{Bt} 1, \mathrm{Bt} 2) \in \mathrm{E}(\mathrm{G})$.
By proceeding in this way, we have (Btn-1, Bxtn) $\mathrm{E}(\mathrm{G})$ for each $\mathrm{n} \quad \mathrm{N}$.
Since (A, B) is $\beta \quad \psi$ - rational contraction with respect to d , for each n 0 , we have $\psi d(B t n, B t n+1)=\psi d(A t n-1, A t n) \quad \beta(\psi(\mathrm{K}(\mathrm{B} t n-1, B t n)))(\psi(\mathrm{K}(\mathrm{B} t n-1, B t n))+\mathrm{LN} \quad(\mathrm{Btn}-1$, Btn)
$K(B t n-1, B t n)=\max \{d(B t n-1, A t n-1) d(A t n, B t n), d(B t n, A t n)[1+d(B t n-1, A t n-1)]$,
$\mathrm{d}(\mathrm{Atn}-1, B \operatorname{tn}-1)[1+\mathrm{d}(\mathrm{Atn}, \mathrm{Btn})]$,
$1+\mathrm{d}(\mathrm{Btn}-1, \mathrm{Btn})$
$\mathrm{d}(\mathrm{Btn}-1, B \operatorname{tn})$
$1+\mathrm{d}(\mathrm{Btn}-1, \mathrm{Btn})$
$d(B t n, A t n-1)[1+d(A t n-1, B t n)], d(B t n-1, B t n), d(B t n-1, A t n)+d(B t n, A t n-1)\}$
$1+\mathrm{d}(\mathrm{Btn}-1, \mathrm{Btn}) \quad 2$
$K(B t n-1, B t n)=\max \{d(B t n-1, B t n) d(B t n+1, B t n), d(B t n, B t n+1)[1+d(B t n-1, B t n)]$,
$\mathrm{d}(\mathrm{Btn}, \mathrm{btn}-1)[1+\mathrm{d}(\mathrm{Btn}+1, B t n)]$,
$1+\mathrm{d}(\mathrm{Btn}-1, \mathrm{Btn})$
$\mathrm{d}(\mathrm{Btn}-1, B \operatorname{tn})$
$1+\mathrm{d}(\mathrm{Btn}-1, \mathrm{Btn})$

```
\(\mathrm{Btn}), \mathrm{d}(\mathrm{Btn}-1, \mathrm{Btn}+1)+\mathrm{d}(\mathrm{Btn}, \mathrm{Btn})\}\)
\(\mathrm{K}(\mathrm{Bt}, \mathrm{Bt})=\max \mathrm{d}(\mathrm{Bt} \quad, \mathrm{Bt}), \mathrm{d}(\mathrm{Bt} \quad, \mathrm{Bt}), \mathrm{d}(\mathrm{Btn}, \mathrm{Btn}-1)[1+\mathrm{d}(\mathrm{Btn}+1, \mathrm{Btn})]\),
\(1+\mathrm{d}(\mathrm{Btn}-1, \mathrm{Btn})\)
\(0, \mathrm{~d}(\mathrm{Btn}-1, \mathrm{Btn}), \mathrm{d}(\mathrm{Btn}-1, \mathrm{Btn}+1)\}\)
\(\leq \max \{\mathrm{d}(\mathrm{Btn}+1, \mathrm{Btn}), \mathrm{d}(\mathrm{B} t n, \mathrm{Btn}-1)[1+\mathrm{d}(\mathrm{B} t n+1, \mathrm{Btn})], \mathrm{d}(\mathrm{Btn}-1, \mathrm{Btn}), \mathrm{d}(\mathrm{Btn}-1, \mathrm{Btn}+1)\}\)
\(1+\mathrm{d}(\mathrm{Btn}-1, \mathrm{Btn}) \quad 2\)
\(\leq \max \{\mathrm{d}(\mathrm{Btn}+1, \mathrm{Btn}), \mathrm{d}(\mathrm{Btn}-1, \mathrm{Btn})\}\)
\(\mathrm{N}(\mathrm{Btn}-1, B t n)=\min \{\mathrm{d}(\mathrm{Btn}-1, A \operatorname{tn}-1) \mathrm{d}(\mathrm{Atn}, \mathrm{Btn}), \mathrm{d}(\mathrm{Btn}, \mathrm{Btn}-1)[1+\mathrm{d}(\mathrm{B} t \mathrm{n}-1, \mathrm{~B} t \mathrm{n})], \mathrm{d}(\mathrm{Btn}-1\),
Btn), d(Btn, At
\(\mathrm{d}(\mathrm{Btn}-1, \mathrm{Btn}) \quad 1+\mathrm{d}(\mathrm{Btn}-1, B t n)\)
\(N(B t n-1, B t n)=\min \{d(B t n-1, B t n) d(B t n+1, B t n), d(B t n, B t n)[1+d(B t n, B t n)], d(B t n-1\),
gxBtn), d(Btn, Btn
d(Btn-1,Btn) \(1+d(B t n-1, B t n)\)
\(=\min \mathrm{d}(\mathrm{Bt} \quad, \mathrm{Bt}), 0[1+0], \mathrm{d}(\mathrm{Bt}, \mathrm{Bt}), \mathrm{d}(\mathrm{Bt}, \mathrm{Bt} \quad)=0\)
\(1+\mathrm{d}(\mathrm{Btn}-1, \mathrm{Btn})\)
If \(\max \{\mathrm{d}(\mathrm{Btn}+1, \mathrm{Btn}), \mathrm{d}(\mathrm{Btn}-1, \mathrm{Btn})\}=\mathrm{d}(\mathrm{Btn}+1, \mathrm{Btn})\)
From (2.1), we have \(\psi(\mathrm{d}(\mathrm{Btn}, \mathrm{Btn}+1))=\psi(\mathrm{d}(\mathrm{Atn}-1, A t n)) \quad \beta(\psi(\mathrm{M}(\mathrm{Btn}-1, B t n)))(\psi(\mathrm{d}(\mathrm{Btn}+1\),
Btn))
LN. 0
Since \(\beta\) S, We get \(\psi(\mathrm{d}(\mathrm{Btn}, \mathrm{Btn}+1))<\psi(\mathrm{d}(\mathrm{Btn}+1, \mathrm{Btn}))\), which is a con- tradiction.
```

Hence $\max \{d(B t n+1, B t n), d(B t n-1, B t n)\}=d(B t n-1, B t n)$
Therefore from (2.1), we have
$\psi(\mathrm{d}(\mathrm{Btn}, \mathrm{Btn}+1))=\psi(\mathrm{d}(\mathrm{Atn}-1, \mathrm{Atn}))<\psi \mathrm{d}(\mathrm{Btn}-1, \mathrm{Btn})$

So, that the sequence $\psi(\mathrm{d}(\mathrm{Btn}, \mathrm{Btn}+1))$ is strictly decreasing sequence of
positive real numbers and so lim
$\mathrm{n} \rightarrow \infty$
$\psi(\mathrm{d}(\mathrm{Btn}, \mathrm{Btn}+1))=\mathrm{r} \geq 0$

We now show thatr $=0$. Suppose that $\mathrm{r}>0$ then from from (2.1) we have
$\psi(\mathrm{d}(\mathrm{Btn}, \mathrm{Btn}+1))=\psi \mathrm{d}(\mathrm{Atn}-1, \mathrm{Atn}) \leq \beta(\psi(\mathrm{K}(\mathrm{Btn}-1, \mathrm{Btn})))(\psi(\mathrm{K}(\mathrm{Btn}-1, \mathrm{Btn}))+\mathrm{LN}(\mathrm{Btn}-1$, Btn)
$\leq \beta(\psi(\mathrm{K}(\mathrm{Btn}-1, \mathrm{Btn})))(\psi(\mathrm{d}(\mathrm{Btn}-1, \mathrm{BTn}))+\mathrm{L} .0$
$\psi(\mathrm{d}(\mathrm{Btn}, \mathrm{Btn}+1)) \leq \beta(\psi(\mathrm{M}(\mathrm{Btn}-1, \mathrm{Btn})))(\psi(\mathrm{d}(\mathrm{Btn}-1, \mathrm{Btn})) \psi(\mathrm{d}(\mathrm{Btn}-1, \mathrm{Btn}) \leq \beta(\psi(\mathrm{M}(\mathrm{Btn}-1$, Btn))) $<1$ for each $n \geq 1$ Now on letting $n \rightarrow \infty$, we get

```
\(1=\lim\)
\(\psi(\mathrm{d}(\mathrm{B} t \mathrm{n}, \mathrm{Btn}+1))\)
\(\beta(\psi(\mathrm{K}(\mathrm{Btn}-1, \mathrm{Btn}))) \leq 1\)
\(\mathrm{n} \rightarrow \infty \quad \psi(\mathrm{d}(\mathrm{Btn}-1, \mathrm{Btn})\)
\(\mathrm{n} \rightarrow \infty\)
so that \(\beta(\psi(\mathrm{K}(\mathrm{Btn}-1, \mathrm{Btn})) \rightarrow 1\) as \(\mathrm{n} \rightarrow \infty\).
From the property of \(\beta \quad \mathrm{S}\), we get lim
\(\mathrm{n} \rightarrow \infty\)
\(\psi(\mathrm{K}(\mathrm{Btn}-1, \mathrm{Btn}))=0\)
so that lim
n
i.e., \(\mathrm{r}=0\)
\(\psi(\mathrm{d}(\mathrm{Btn}-1, \mathrm{Btn}))=0\)
```

Now, we show that the sequence $\{B \operatorname{tn}\}$ is a Cauchy sequence. Suppose that $\{B \operatorname{tn}\}$ is not a Cauchy sequence. Then there exist an $\epsilon>0$ such that, for all $k \in N$,there are
sequences of positive integers $\{\mathrm{m}(\mathrm{k})\}$ and $\{\mathrm{n}(\mathrm{k})\}$ with $\mathrm{m}(\mathrm{k})>\mathrm{n}(\mathrm{k})>\mathrm{k}$ and $\mathrm{d}(\mathrm{Btm}(\mathrm{k}), \mathrm{Btn}(\mathrm{k}))$
$\geq \epsilon$ and $\mathrm{d}(\mathrm{Btm}(\mathrm{k})-1, \mathrm{Btn}(\mathrm{k}))<\epsilon \epsilon \leq \mathrm{d}(\mathrm{Btn}(\mathrm{k}), \mathrm{Btm}(\mathrm{k}))$
$\leq \mathrm{d}(\operatorname{Btn}(\mathrm{k}), \operatorname{Btm}(\mathrm{k})-1)+\mathrm{d}(\operatorname{Btm}(\mathrm{k})-1, \operatorname{Btm}(\mathrm{k}))$
$<\epsilon+\mathrm{d}(\mathrm{Btm}(\mathrm{k})-1, \operatorname{Btm}(\mathrm{k}))$

Taking as k and using lim
$\mathrm{n} \rightarrow \infty$
$\mathrm{d}(\operatorname{Btn}, \operatorname{Bt}(\mathrm{n}+1))=0$,
we get lim
$\mathrm{n} \rightarrow \infty$
$\mathrm{d}(\mathrm{Btm}(\mathrm{k}), \mathrm{Bt}(\mathrm{n}(\mathrm{k})))=\epsilon>0$.

```
Since E(G) has the transitivity property, we get that (gxm(k), gxn(k)) \in
E)G) for every k \in N}\mathrm{ , we get
\psi(d(Btn(k)+1, Btm(k) + 1)) = \psi(d(Atn(k), Atm(k)))
\leq \beta(K(Btn(k), Btm(k)))\psi(K(Btn(k), BTm(k))) + L.N (Btn(k), Btm(k))
Now K(Btn(k), Btm(k))) = max{ d(Btn(k),Atn(k))d(Atm(k),Btm(k)) ,
d(Btm(k),Btm(k))[1+d(Btn(k),Atn(k))],
d(Atn(k),Btn(k))[1+d(Atm(k),Btm(k))] 1+d(Btn(k),Btm(k))
d(Btn(k),Btm(k))
1+d(Btn(k),Btm(k))
d(Btm(k),Atn(k))[1+d(Atn(k),Btm(k))] , d(Btn(k), Btm(k)),
d(Btn(k),Atm(k))+d(Btm(k),Atn(k))}
K(Bt
(k), Bt
(k))) = max{ d(Btn(k), Btn(k)+1)d(Btm(k)+1,Btm(k))
d(Btm(k),Btm(k)+1)[1+d(Btn(k),Btn(k)+1)],
d(Btn(k)+1,Btn(k))[1+d(Btm(k)+1,Btm(k))] 1+d(Btn(k),Btm(k))
d(Btm(k),Btn(k)+1)[1+d(Btn(k)+1,Btm(k))] 1+d(Btn(k),Btm(k))
```

$\mathrm{n}(\mathrm{k}), \mathrm{Btm}$
(k)), $\mathrm{d}(\mathrm{B} \operatorname{tn}(\mathrm{k}), \mathrm{Btm}(\mathrm{k})+1)+\mathrm{d}(\mathrm{Btm}(\mathrm{k}), \mathrm{B} \operatorname{tn}(\mathrm{k})+1)\}$

On letting k and using lim
$\mathrm{k} \rightarrow \infty$
$d(B \operatorname{tn}, B \operatorname{tn}+1))=0$
lim

## K (Bt

(k), Bt
$(\mathrm{k})))=\lim$
$\mathrm{d}(\mathrm{Btm}(\mathrm{k}), \mathrm{Btn}(\mathrm{k})+1)[1+\mathrm{d}(\mathrm{Btn}(\mathrm{k})+1, \mathrm{Btm}(\mathrm{k}))], \mathrm{d}(\mathrm{Bt}$
(k), Bt
(k)), $\mathrm{d}(\operatorname{Btn}(\mathrm{k}), \mathrm{B}$
$\mathrm{n}_{\mathrm{k} \rightarrow \infty} \mathrm{m}$
$\mathrm{k} \rightarrow \infty$
$1+\mathrm{d}(\operatorname{Btn}(\mathrm{k}), \operatorname{Btm}(\mathrm{k})) \quad \mathrm{n} \quad \mathrm{m}$
$\lim _{\mathrm{k}}$
$\lim _{\mathrm{k} \rightarrow \infty}$
$\mathrm{K}(\operatorname{Btn}(\mathrm{k}), \operatorname{Btm}(\mathrm{k})))=\epsilon$
$\mathrm{N}(\mathrm{Btn}(\mathrm{k}), \operatorname{Btm}(\mathrm{k})))=0$
$1=\lim$
$\psi(\mathrm{d}(\mathrm{Btn}(\mathrm{k}), \mathrm{Btn}(\mathrm{k})+1))$
$\beta(\psi(\mathrm{M}(\mathrm{Bt}$
, $\operatorname{Bt}$
$(\mathrm{k})))) \leq 1$
$\mathrm{k} \rightarrow \infty \quad \psi(\mathrm{d}(\operatorname{Btn}(\mathrm{k})-1, \mathrm{Btn}(\mathrm{k}))$
$\mathrm{n} \rightarrow \infty$
$n(k)-1 n$
so that $\beta(\psi(M(B \operatorname{tn}(k)-1, B \operatorname{tn}(k))) \rightarrow 1$ as $k \rightarrow \infty$.
From the property of $\beta \quad$ S, we get lim
$\mathrm{k} \rightarrow \infty$
$\psi(\mathrm{M}(\mathrm{B} \operatorname{tn}(\mathrm{k})-1, \mathrm{~B} \operatorname{tn}(\mathrm{k})))=0$
so that $\lim$
$\mathrm{k} \rightarrow \infty$
$\psi(\mathrm{d}(\mathrm{B} \operatorname{tn}(\mathrm{k})-1, \mathrm{~B} \operatorname{tn}(\mathrm{k})))=0$, which is a contradiction.

Hence the sequence $\{g x n\}$ is a Cauchy sequence in the metric space (X, d).
Now, we have to prove that the sequence Btn is a Cauchy sequence in the metric space ( $\mathrm{M}, \mathrm{dJ}$ ).
When d dJ the proof is trivial. So that we consider $\mathrm{d} \S \mathrm{dJ}$.
Let $\epsilon>0$. Since the sequence $\{\operatorname{Bt}(\mathrm{n})\}$ is a Cauchy in the metric space $(\mathrm{M}, \mathrm{d})$ and the function $A$ is $B-$ Cauchy on $M$. We have $A(M) \subset B(M)$, we can obtain that $\{\operatorname{At}(n)\}$ is a Cauchy in the metric space ( $\mathrm{M}, \mathrm{dJ}$ ). So, there
a number n 0 N such that $\mathrm{dJ}(\mathrm{Btm}+1, \mathrm{Btn}+1)=\mathrm{dJ}(\mathrm{Atm}, A$ tn $)<\epsilon$ for all $\mathrm{m}, \mathrm{n} \quad \mathrm{N} 0$ and hence Btn is Cauchy's sequence in ( $\mathrm{X}, \mathrm{dJ}$ ).
$B(M)$ is a d' -closed subset of $(M, d J)$, and which is complete, then there
exist $\mathrm{z}=\mathrm{gt} \in \mathrm{B}(\mathrm{M})$ such that $\lim$
$B t n=\lim$

Atn $=\mathrm{z}$.

J J n $\rightarrow \infty$
$\mathrm{n} \rightarrow \infty$

We have A : (M, d) (M, d) is a G- continuous function such that A and B are dJ - compatible
lim
$\mathrm{n} \rightarrow \infty$
$\mathrm{d}(\mathrm{BAtn}, \mathrm{ABtn})=0 /$.
J J J

Consider d(Bu, Au) d (Bu, BAtn) $+\mathrm{d}(\mathrm{BAtn}, \mathrm{ABtn})+\mathrm{d}(\mathrm{ABtn}, \mathrm{Au})$
taking limit as $n$, we get that $\mathrm{dJ}(\mathrm{Az}, \mathrm{Bz})=0$, and from continuity of B and that A is G - continuous.
Therefore $\mathrm{Az}=\mathrm{Bz}$. Which implies that z is a coincidence point of A and B.

Q
Theorem 3.2. In addition to the hypothesis of the above theorem 2.1 A and $B$ are weakly compatible the A and B have a common fixed point.

Proof. From the proof of theorem 2.1 Btn is non decreasing sequence and converges to Bz and $\mathrm{Bz}=\mathrm{Az}$.
Since $A$ and $B$ are weakly compatible, we have $A B z=B Z z$. Now $A z=B z=u(s a y)$
Also, $\mathrm{Au}=\mathrm{ABz}=\mathrm{BAz}=\mathrm{Bu}$
If $z=u$ then $u$ is a common fixed point of $A$ and $B$.
if $\mathrm{z} \quad \mathrm{u}$, i.e., $\mathrm{d}(\mathrm{z}, \mathrm{u})>0$
$\psi(\mathrm{d}(\mathrm{Bz}, \mathrm{Bu}))=\psi(\mathrm{d}(\mathrm{Az}, \mathrm{Au})) \leq \beta(\psi(\mathrm{K}(\mathrm{Bz}, \mathrm{Bu}))) \psi(\mathrm{K}(\mathrm{Bz}, \mathrm{Bu}))+\mathrm{L} . \mathrm{N}(\mathrm{Bz}, \mathrm{Bu})$
$K(B z, B u)=\max \{d(B z, A z) d(A u, g B u), d(B u, A u)[1+d(B z, A z)], d(A z, B z)[1+d(A u, B u)]$, $\mathrm{d}(\mathrm{Bu}, \mathrm{Az})[1+\mathrm{d}(\mathrm{Az}, \mathrm{Bu})], \mathrm{d}(\mathrm{Bz}, \mathrm{Bu}), \mathrm{d}(\mathrm{Bz}, \mathrm{Au})+\mathrm{d}(\mathrm{Bu}, \mathrm{Az})\}$
$K(B z, B u)=\max \{d(u, u) d(A u, B u), d(B u, B u)[1+d(u, u)], d(u, u)[1+d(B u, B u)]$, $\mathrm{d}(\mathrm{Bu}, \mathrm{u})[1+\mathrm{d}(\mathrm{u}, \mathrm{Bu})], \mathrm{d}(\mathrm{u}, \mathrm{Bu}), \mathrm{d}(\mathrm{u}, \mathrm{Bu})+\mathrm{d}(\mathrm{Bu}, \mathrm{u})\}$
$K(B z, B u)=\max \{0,0,0, d(B u, u), d(u, B u), d(u, B u)+d(B u, u)\}$
$K(B z, B u)=d(B u, u)=d(B z, B u)$
$\mathrm{N}(\mathrm{Bz}, \mathrm{Bu})=\min \{\mathrm{d}(\mathrm{Bz}, \mathrm{Bz}) \mathrm{d}(\mathrm{Au}, \mathrm{Bu}), \mathrm{d}(\mathrm{Bu}, \mathrm{Az})[1+] \mathrm{d}(\mathrm{Az}, \mathrm{Bu}), \mathrm{d}(\mathrm{Bz}, \mathrm{Bu}), \mathrm{d}(\mathrm{Bu}, \mathrm{Au})\}$
$\mathrm{N}(\mathrm{Bz}, \mathrm{Bu})=\min \{\mathrm{d}(\mathrm{u}, \mathrm{u}) \mathrm{d}(\mathrm{Bu}, \mathrm{Bu}), \mathrm{d}(\mathrm{Bu}, \mathrm{u})[1+] \mathrm{d}(\mathrm{u}, \mathrm{Bu}), \mathrm{d}(\mathrm{Bz}, \mathrm{Bu}), \mathrm{d}(\mathrm{Bu}, \mathrm{Bu})=$
$\mathrm{d}(\mathrm{u}, \mathrm{Bu})$
$0\}$
$1+\mathrm{d}(\mathrm{u}, \mathrm{Bu})$
$\psi(\mathrm{d}(\mathrm{Bz}, \mathrm{Bu}))=\psi(\mathrm{d}(\mathrm{Az}, \mathrm{Au})) \leq \beta(\psi(\mathrm{M}(\mathrm{Bz}, \mathrm{Bu}))) \psi(\mathrm{d}(\mathrm{Bz}, \mathrm{Bu}))+\mathrm{L} .0$
$1=\psi(\mathrm{d}(\mathrm{Bz}, \mathrm{Bu})) \leq \beta(\psi(\mathrm{M}(\mathrm{Bz}, \mathrm{Bu})))<1$.
Hence $\mathrm{Bz}=\mathrm{Bu}$
$\mathrm{Bu}=\mathrm{Au}=\mathrm{u}$, there fore u is a common fixed point of A and B .

Q
Theorem 3.3. In addition to the hypothesis of the above theorem 2.1 For any $x, y \in C(A, B)$, such that $\mathrm{Bx} /=\mathrm{By}$, we have $(\mathrm{Bx}, \mathrm{By}) \in \mathrm{E}(\mathrm{G})$. If A and B are dJ- compatible and $\mathrm{X}(\mathrm{A}, \mathrm{gB})$ $/=\varphi$, then $\operatorname{Cm}(\mathrm{A}, \mathrm{B}) /=\varphi$.

Proof. From the theorem (2.1), there exists a coincidence point $x \quad X$, i.e., $g x=f x$.

Suppose that there exists another coincidence point y $\quad$ X such that $g y=$ fy,
Assume that $\mathrm{Bx} /=\mathrm{By}$.
From the assumption $(B x, B y) \in E(G)$
$\psi(\mathrm{d}(\mathrm{Ax}, \mathrm{Ay})) \leq \beta(\psi(\mathrm{K}(\mathrm{Bx}, \mathrm{By})) \psi(\mathrm{K}(\mathrm{Bx}, \mathrm{gBy}))+\mathrm{L} . \mathrm{N}(\mathrm{Bx}, \mathrm{By})$, for $\mathrm{L} \geq 0$ where $\mathrm{K}: \mathrm{MxM} \rightarrow$ $[0, \infty)$ is a function such that, for any $x, y \in X, K(B x, B y)=\max \{d(B x, A x) d(A y, B y)$, $d(B y, A y)[1+d(B x, A x)], d(A x, B x)[1+d(A y, B y)]$,
d(By,Ax)[1+d(Ax,By)], d(Bx, By), d(Bx,Ay)+d(By,Ax) \}
$K(B x, B y)=\max \{d(B x, A x) d(B y, B y), d(B y, B y)[1+d(B x, B x)], d(B x, B x)[1+d(B y, B y)]$, $\mathrm{d}(\mathrm{By}, \mathrm{Bx})[1+\mathrm{d}(\mathrm{Bx}, \mathrm{By})], \mathrm{d}(\mathrm{Bx}, \mathrm{By}), \mathrm{d}(\mathrm{Bx}, \mathrm{By})+\mathrm{d}(\mathrm{By}, \mathrm{Bx})\}=\mathrm{d}(\mathrm{Bx}, \mathrm{By})$
$1+\mathrm{d}(\mathrm{Bx}, \mathrm{By}) \quad 2$
$\mathrm{N}(\mathrm{Bx}, \mathrm{By})=0$
therefore $\psi(\mathrm{d}(\mathrm{Ax}, \mathrm{Ay})) \quad \beta(\psi(\mathrm{M}(\mathrm{Bx}, \mathrm{By})) \psi(\mathrm{M}(\mathrm{Bx}, \mathrm{By}))+\mathrm{L} . \mathrm{N}(\mathrm{Bx}, \mathrm{By})<\psi(\mathrm{d}(\mathrm{Ax}, \mathrm{Ay}))$
which is a contradiction.
Therefor Bx = By.
Lett0 $=\mathrm{t}$, and define the sequence $\{\mathrm{tn}\}$ by $\mathrm{Btn}=\mathrm{Atn}-1$ for each $\mathrm{n} \in \mathrm{N}$. Since t is a coincidence point of $A$ and $B$, we have $B t n=A t$ for each $n \quad N$.
Now let w = Bt
therefore $\mathrm{Bw}=\mathrm{BBt}=\mathrm{BAt}$
By the definition of the sequence $\{\mathrm{tn}\}, \mathrm{Btn}=\mathrm{At}=\mathrm{Atn}-1$ for each $\mathrm{n} \in \mathrm{N}$.

$$
\begin{aligned}
& \lim _{\mathrm{n} \rightarrow \infty} \\
& \mathrm{Atn}=\lim \\
& \mathrm{n} \rightarrow \infty \\
& \mathrm{Btn}=\mathrm{At} . \\
& \mathrm{J} \quad \mathrm{~J} \\
& \text { i.e., } \mathrm{BAt}=\mathrm{Abt} .
\end{aligned}
$$

$\mathrm{n} \rightarrow \infty$

There fore, we have $\mathrm{Bw}=\mathrm{BAt}=\mathrm{ABt}=\mathrm{Aw}$ and hence $w$ is another coincidence point of A and B . Now $\mathrm{Aw}=\mathrm{Bw}=\mathrm{Bt}=\mathrm{w}$ Therefore w is a common fixed point of A and B . i.e., $\mathrm{Cm}(\mathrm{A}, \mathrm{B}) /=\varphi$. $\quad \mathrm{Q}$

## 4. COROLLARIES AND EXAMPLES

When $\psi(t)$ is identity map, we have the following.

Definition 3.1 Let $(M, d)$ be a metric space endowed with a directed Graph $G=(V(G), E(G))$, and let $A, B: M \quad M$ be functions. The pair $A, B$ is is said to be $\beta$ rational contraction with respect to d if
(1) A is B -edge preserving with respect to G ;
(2) there exists two functions $\beta \quad \mathrm{S}$ and $\psi \quad \Psi$ such that, for all $\mathrm{x}, \mathrm{y} \quad \mathrm{X}$
with (Bx, By) $\mathrm{E}(\mathrm{G})$, we have
$(d(A x, A y)) \quad \beta(K(B x, B y)(K(B x, B y)+L \cdot N(B x, B y)$, for $L \quad 0$
where $\mathrm{M}: \mathrm{XxX} \quad[0, \quad)$ is a function such that, for any $\mathrm{x}, \mathrm{y} \mathrm{X}$,
$d(B x, A x) d(A y, B y) d(B y, A y)[1+d(B x, A x)] d(A x, B x)[1+d(A y, B y)]$
$d(B y, A x)[1+d(A x, B y)], d(B x, B y), d(B x, A y)+d(B y, A x)\}$
$\mathrm{N}(\mathrm{Bx}, \mathrm{By})=\min \{\mathrm{d}(\mathrm{Bx}, \mathrm{Ax}) \mathrm{d}(\mathrm{A}, \mathrm{By}), \mathrm{d}(\mathrm{By}, \mathrm{Ax})[1+\mathrm{d}(\mathrm{Ax}, \mathrm{By}), \mathrm{d}(\mathrm{Bx}, \mathrm{By}), \mathrm{d}(\mathrm{By}, \mathrm{Ay})\}$

Corollary 4.1. Let ( $\mathrm{M}, \mathrm{dJ}$ ) be a complete metric space endowed with a di- rected graph $\mathrm{G}=$ (V (G), E(G)), let d be another metric on M, and let A, B : M M be functions. Suppose that $(A, B)$ is an $\beta$ - weak rational contraction with respect to d, Further, assume that the following conditions satisfied:
(i) $\quad M:(M, d J)(M, d J)$ is a continuous function such that $S(X)$ is dJ- closed;
(ii) $\quad \mathrm{A}(\mathrm{X}) \quad \mathrm{B}(\mathrm{X})$;
(iii) $\mathrm{E}(\mathrm{G})$ is transitive ;
(iv) If d § dJ , a : (M, d) (M, dJ) is G- Cauchy on M;
(v) $\quad \mathrm{f}:(\mathrm{M}, \mathrm{d}) \quad(\mathrm{M}, \mathrm{dJ})$ is G - continuous, and A and B are dJ -compatible.
then A and A have a coincident points.
When $L=0$, we have the following.
Definition 3.2 Let (M, d) be a metric space endowed with a directed Graph $G=(V(G), E(G))$, and let $A, B: M \quad M$ be functions. The pair $A, B$ is is said to be $\beta \psi$ - rational contraction with respect to $d$ if
(1) A is B -edge preserving with respect to G ;
(2) there exists two functions $\beta \in S$ and $\psi \in \Psi$ such that, for all $x, y \in X$
with $(\mathrm{Bx}, \mathrm{By}) \in \mathrm{E}(\mathrm{G})$, we have
$\psi(\mathrm{d}(\mathrm{Ax}, \mathrm{Ay})) \leq \beta(\psi(\mathrm{K}(\mathrm{Bx}, \mathrm{By})) \psi(\mathrm{K}(\mathrm{Bx}, \mathrm{By}))+$,
where $\mathrm{K}: \mathrm{MxM} \rightarrow[0, \infty)$ is a function such that, for any $\mathrm{x}, \mathrm{y} \in \mathrm{M}$, $K(B x, B y)=\max \{d(B x, A x) d(f A y, B y), d(B y, A y)[1+d(B x, A x)], d(A x, B x)[1+d(A y, g B y)]$, d(By,Ax)[1+d(Ax,By)],d(Bx, By), d(Bx,Ay)+d(By,Ax) \}
Corollary 4.2. Let ( $\mathrm{X}, \mathrm{dJ}$ ) be a complete metric space endowed with a di- rected graph $\mathrm{G}=$ $(\mathrm{V}(\mathrm{G}), \mathrm{E}(\mathrm{G})$ ), let d be another metric on X , and let $\mathrm{A}, \mathrm{B}: \mathrm{X}$ X be functions. Suppose that ( $\mathrm{f}, \mathrm{g}$ ) is an $\beta \psi$ - rational contraction with respect to d , Further, assume that the following conditions satisfied:
(i) $\quad B:(M, d J)(M, d J)$ is a continuous function such that $A(X)$ is dJ- closed;
(ii) $\quad \mathrm{A}(\mathrm{X}) \quad \mathrm{B}(\mathrm{X})$;
(iii) $\mathrm{E}(\mathrm{G})$ is transitive ;
(iv) If d § dJ, A : (M, d) (M, dJ) is G- Cauchy on m;
(v) $\quad \mathrm{A}:(\mathrm{M}, \mathrm{d}) \quad(\mathrm{M}, \mathrm{dJ})$ is G- continuous, and A and A are dJ -compatible.
then $A$ and $B$ have a coincident points.
Now we present an example in support of Theorem 2.2.
Example 4.3. Let $\mathrm{M}:[0,1]$ and define the metrics d , $\mathrm{dJ}: \mathrm{M} \rightarrow \mathrm{M}$ defined by $\mathrm{d}(\mathrm{x}, \mathrm{y})=\mid \mathrm{x}-$ $\mathrm{y}|, \mathrm{dJ}(\mathrm{x}, \mathrm{y})=\mathrm{K}| \mathrm{x}-\mathrm{y} \mid \forall \mathrm{x}, \mathrm{y} \in \mathrm{M}$, where $\mathrm{k}>1$. Clearly
Now we define $\mathrm{E}(\mathrm{G})=\{(\mathrm{x}, \mathrm{y}) / \mathrm{x}=\mathrm{y}$ or $\mathrm{x}, \mathrm{y} \in[0,1]$ with $\mathrm{x} \leq \mathrm{y}\}$ Define the mappings $\mathrm{A}: \mathrm{M} \rightarrow \mathrm{M}$ and $\mathrm{B}: \mathrm{M} \rightarrow \mathrm{M}$ by $\mathrm{A}(\mathrm{x})=\mathrm{x}$ and $\mathrm{B}(\mathrm{x})=\mathrm{x}$ $\forall x \in M$.

Define $\psi(\mathrm{t})=\mathrm{t}$, for all t , and define $\beta:[0, \infty) \rightarrow[0,1)$ bt $\beta(\mathrm{t})=1+\mathrm{t}, \mathrm{t} \geq 0$

2
Let $(B x, B y) \in E(G)$, if $x=y$ then $(A x, A y) \in E(G)$
$1+2 \mathrm{t}$

If ( $\mathrm{Bx}, \mathrm{By}$ ) $\in \mathrm{E}(\mathrm{G})$ with $\mathrm{Bx} \leq \mathrm{By}$, then we get $\mathrm{Bx}=\mathrm{x} \leq \mathrm{By}=\mathrm{y}$
$A x=x \leq A y \leq y$ and $A x, A y \in[0,1]$ that implies $A x, A y \in E(G)$
Let $x$, $y$ be arbitrary in $M$ and ( $B x, B y$ ) $E(G)$
If $B x=B y$ then we get $x=y$, inequality in Theorem 2.1 holds. Suppose $B x=x, B y=y$ in $[0,1]$.
$\psi(\mathrm{d}(\mathrm{Ax}, \mathrm{Ay}))=\psi(\mathrm{d}(\mathrm{x}, \mathrm{y})))=\psi(|\mathrm{x}-\mathrm{y}|))=|\mathrm{x}-\mathrm{y}|$
$d(x, x) d(y, y) d(y, y)[1+d(x, x)] d(x, x)[1+d(y, y)]$

$d(y, x)[1+d(x, y)]$
d(x,y)
$d(x, y)+d(y, x)$
$1+\mathrm{d}(\mathrm{x}, \mathrm{y})$
$1+\mathrm{d}(\mathrm{x}, \mathrm{y})$
$2 \quad 2$
$1+\mathrm{d}(\mathrm{x}, \mathrm{y})$
$222\}$
x. y
$y .[1+x] \quad x[1+y]|y-|[1+|-y|]$
$\left|x^{-} \quad\right|+|y-\quad|$
$\mathrm{K}(\mathrm{Bx}, \mathrm{By})=\max \{\| 22$
, $22,22,22 \quad,|x-y|$,
$222\}$
$\mathrm{x}-\mathrm{y} \|$
$K(B x, B y)=|x-y|$
$1+|\mathrm{x}-\mathrm{y}| \quad 1+|\mathrm{x}-\mathrm{y}| \quad 1+|\mathrm{x}-\mathrm{y}|$
$d(x, x) d(y, y) d(y, x)[1+d(x, y)] \quad y$
$\mathrm{N}(\mathrm{Bx}, \mathrm{By})=\min \left\{\begin{array}{ll}2 & 2\end{array} \quad 2 \quad 2, \mathrm{~d}(\mathrm{x}, \mathrm{y}), \mathrm{d}(\mathrm{y}, 2)\right\}$

```
x . y

2 )
1+2 x-y|
|-y|)+L.
| 2y-x |[1+| x-2y |]
1+|x-y|
```

holds for some $\mathrm{L} \geq 0$

Conclusion We proved the existence of common fixed points of $\beta \psi$ weak generalized rational contraction mappings with two metrics spaces en- dowed with a directed graph. We used a Graph Structure to prove the presence Common fixed points of Geraghty generalized rational type weak contraction maps with altering distance functions. We derived some corol- laries from main results and provided examples in support of our results.
